1. INTRODUCTION

1.1 Project Overview:

Retailers struggle because they lack a structured strategy for keeping track of their inventory data. Because they only retain the inventory data in the logbook and are not properly organized, the admin finds it challenging to record the data promptly and safely. Managing inventory with this paperwork and manual processes is tedious and not secure. And it doesn't easily scale across multiple warehouses with lots of stock. Moreover, customer demand is constantly shifting. Keeping too much could result in obsolete inventory where you're unable to sell, while keeping too little could leave you unable to fulfill customer orders. To properly manage the inventory and run their business, the retailer needs a technique to effectively analyze conditions, avoid out-of-stock problems, avoid overstocking, and keep customers coming back.

1.2 Purpose:

The main goals are to effectively run the business, manage the inventory, prevent out-of-stock issues, avoid overstocking, and keep consumers coming back. With the right platform, operations can be automated, inventory management techniques can be improved, and customer experiences can be enhanced. We can create a programme that keeps track of the stock on hand and alerts the retailer when there is running low supply. The retailer must also constantly verify the stock count and must deliver the goods without delay and on time.

2. LITERATURE SURVEY

2.1 Existing problem:

Retailers struggle because they lack a structured strategy for keeping track of their inventory data. Because they only retain the inventory data in the logbook and are not properly organised, the admin finds it challenging to record the data promptly and safely. To properly manage the inventory and run their business, the retailer needs a technique to effectively analyze conditions, avoid out-of-stock problems, avoid overstocking, and keep customers coming back.

2.2 References:

Inventory management for retail companies: A literature review and current trends:

This article's objective is to examine and summarize a large body of literature on inventory management that includes numerous definitions and key ideas for the retail industry. To identify the primary trends and indicators of inventory management in Small and Medium-sized Enterprises, a systematic literature study was conducted (SMEs). The five-year study period between 2015 and 2019 focuses solely on the retail industry. The main findings of this study include the top inventory control and management models, the Key Performance Indicators (KPIs) for managing

them correctly, and the advantages and difficulties of selecting or implementing an effective system. According to this research, there are 22 crucial inventory management KPIs that must be taken into account when shops assess their inventories. Ten main indicators were established from them, including inventory level, actual inventory and its connection to the business' information system, shortage or shortage frequency, frequency of product reordering or replenishment, service level, replacement frequency, product availability, inventory excess, number of items on the shelf, and level of income or profit. These indications enable the business to monitor stock levels, manage them effectively, and present a high level of customer service and product availability.

Case Study on an Android App for Inventory Management System with Sales Prediction for Local Shopkeepers in India:

In this article, the author proposed the idea of developing a mobile app that offers all the functionality of a point-of-sale system and provides insight into potential future sales is a very affordable and practical solution to this issue. It will make it possible for store owners to monitor their current goods purchases and billing. They will be able to modify their investments in goods and supply because of the predictive sales analysis, ensuring maximum profitability. A store's customer base will grow if it has pertinent items that meet customer needs. According to the study, the crucial part of this mobile app is sales prediction and analysis and this can be done by using data mining algorithms to the customer information that has been gathered as well as the temporal data that the merchants have provided. Regression Analysis is the algorithm that works best in this situation.

Implementation of inventory management system:

The objective of this study is to develop a system that effectively manages all the data regarding the dealer, supplier, manufactured goods, and raw materials. The many issues with storing unstructured data can be resolved using MongoDB, which saves data row-by-row and supports indexing. Other NoSQL databases like Cassandra and Neo4j do not have this feature. Hence, the data is stored in MongoDB on the backend, and the frontend is created using Java on NetBeans to provide a good Graphical User Interface (GUI), allowing anyone to access the inventory without any technical knowledge. Every day, the entire E-Commerce department stores a tonne of data, which can occasionally lead to huge things going missing, bad inventory management, and losing sight of their database. The customers also play a significant role in creating this situation by altering the products in the cart, leaving the cart with things at any time, which causes issues at checkout, and frequently canceling the orders. A system that not only stores this changing data, but also manages it effectively, is absolutely necessary. The present project might assist in fixing the issue and providing the agreed-upon quality of customer service.

A Proficient Process for Systematic Inventory Management:

The proposed approach controls an organization's inventory and aids in a better analysis of data relating to the storage and sale of items so that pertinent insights can be drawn from it. The system can be used to generate sales reports daily, weekly, or monthly in the form of different visualization charts by storing and updating the details of the inventory, stock maintenance, and system. It suggests creating a system for storing data by keeping track of the stock information for products classified under different brands and categories. The system recognises the necessity for an input device, a locked enclosure, a computer device, a data store, and a portal site or application in order to provide a comprehensive environment for effective warehouse and inventory management. The portal, application, computing device, and data repository must all be connected via the internet or a dispersed network. The system offers a technique that will make use of the idea of data analysis to supply details on the most popular, lucrative, and uninteresting stocks.

Design and implementation of Store Management System:

Delivering an improving client experience is both an opportunity and a challenge in this era of technology expansion and growing customer demands. Store management hires a retailer to give in-store retail customers a more engaging and modern shopping experience. With the help of this innovation, the store administrators will be able to exchange data consistently with all other participants in the inventory network. Additionally, it can prevent "loss of offer" problems to a greater extent by acting proactively. The store management identifies and monitors items in the shelves and automatically alerts retailers when it's time to restock. Automation will take the place of the human data collection process, allowing businesses to obtain data instantly and without encoding or manual involvement. This paper proposes a new feature that will notify the store manager when a shelf is empty and out of stock. So that the store manager can swiftly fill orders that are out of stock by informing the store

2.3 Problem Statement Definition:

To develop an application that tracks the stock available and gets notified to the retailer about the low stock beforehand and also needs to regularly check the stock count and should deliver the products on time without delay.

3. IDEATION & PROPOSED SOLUTION:

3.1 Empathy Map Canvas

[Github link:](#)

[Empathy Map - Github](#)

3.2 Ideation & Brainstorming:

Template

Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

10 minutes to prepare
1 hour to collaborate
30 pages recommended

Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going:

- Team gathering
- Define your goal
- Set the agenda
- Learn how to use the facilitation tools

10 minutes

Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

5 minutes

Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

Key rules of brainstorming

To run an smooth and productive session:

- Stay on topic.
- Encourage wild ideas.
- Order judgments.
- Listen to others.
- Be open to volume.
- If possible, be visual.

HARMONIUS DIVERGENT CM JAZZY SIS SENSITIVE

Share template feedback

Need some inspiration? See a finished template or download your own.

Get started →

Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and break it up into smaller sub-groups.

⌚ 20 minutes

Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

⌚ 30 minutes

After you collaborate

You can export the mural as an image or pdf to share with members of your company who might find it helpful.

Quick add-ons

- Share the mural**: Share a view link to the mural with stakeholders to keep track of the progress of the session.
- Export the mural**: Export the entire mural as a PNG or PDF to attach to emails, include in slides, or save in your drive.

Keep moving forward

- Strategy blueprint**: Define the components of a new idea or plan.
- Customer experience journey map**: Understand customer needs, expectations, and obstacles for an experience.
- Strengths, weaknesses, opportunities & threats**: Identify strengths, weaknesses, opportunities, and threats for a strategy plan.

3.3 Proposed Solution:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Retailers struggle because they lack a structured strategy for keeping track of their inventory data. Because they only retain the inventory data in the logbook and are not properly organised, the admin finds it challenging to record the data promptly and safely. To properly manage the inventory and run their business, the retailer needs a technique to effectively analyse conditions, avoid out-of-stock problems, avoid overstocking, and keep customers coming back.
2.	Idea / Solution description	Processes can be automated, inventory management procedures can be improved, and customer experiences can be improved with the correct platform. Developing an application that tracks

		the stock available and gets notified to the retailer about the low stock beforehand and also needs to regularly check the stock count and should deliver the products on time without delay.
3.	Novelty / Uniqueness	<ul style="list-style-type: none"> ● Increased sales ● Track inventory across many sites ● Schedule production and distribution ● Online and offline order management ● Increased scalability and flexibility with a variety of add-ons ● Simple and affordable pricing. ● Increased customer satisfaction with end-to-end tracking ● Handle reorder points automatically ● Forecast demand
4.	Social Impact / Customer Satisfaction	<p>Customers will be satisfied because less time will be wasted looking for a product that isn't available.</p> <p>Retailers' workloads will be kept to a minimum if the system is automated every day and every time a purchase is made.</p> <p>Receiving prompt and appropriate responses from the shops will increase customer satisfaction.</p>
5.	Business Model (Revenue Model)	Demand and supply must be balanced, financial and operational planning must be combined, and high-level strategic plans must be connected to medium- and long-term company plans. Inventory management aids businesses in determining which stock to order when and in what quantities.
6.	Scalability of the Solution	<p>A company will have the framework and real-time metrics it needs to stay competitive and meet its growth objectives with an automated inventory management system.</p> <p>There will be an improvement in corporate profitability and effectiveness.</p> <p>Implementing a system that anybody and anywhere may use to purchase goods can be advantageous.</p>

		The stock can be updated daily and after every purchase to stop inventory shrinkage.

[Proposed Solution-Github](#)

3.4 Problem Solution fit:

Define CS, fit into CC Focus on J&P, tap into BE, understand RC	1. CUSTOMER SEGMENT(S) CS Inventory management aids businesses in determining which merchandise to order when and in what quantities. These are used by managers, accountants and production team to keep a track of demand and supply of products in company.	6. CUSTOMER CONSTRAINTS CC The customer might initially face constraints with application usage and might need stock knowledge	5. AVAILABLE SOLUTIONS AS Manual inventory tracking is possible, but it results in longer order processing, more labour expenses, and larger inventory write-offs at the end of the year	Explore AS, differentiate Focus on J&P, tap into BE, understand RC
	2. JOBS-TO-BE-DONE / PROBLEMS J&P The primary challenges of inventory management are having too much inventory and not being able to sell it, not having enough inventory to fulfill orders, and not understanding what items you have in inventory and where they're located. Other obstacles include: - Getting Accurate Stock Details - Poor Processes - Changing Customer Demand - Using Warehouse Space Well	9. PROBLEM ROOT CAUSE RC - Inaccurate information about stock movement - Demands of consumers change day by day	7. BEHAVIOUR BE - Track and monitor the incoming and outgoing of stocks. - To update available quantity information onto cloud frequently. - Know the market trends and adapt accordingly to increase the profitability. - Manage the inventory efficiently to avoid out of stock	
Identify strong TR & EM Focus on TR, tap into EM	3. TRIGGERS TR - Fluctuating customer demand - Market competition - Management of resources - Management of demand and supply	10. YOUR SOLUTION SL The issue arises due to the lack of communication between the supplier and the production managers. So, the aim is to develop a cloud application that provides an easy way to manage the sales and purchases and track inventory.	8.CHANNELS of BEHAVIOUR CH ONLINE - Alerting the particular person about the stocks limits, either full or empty or even about the reach of a particular limit - Updating of flow of the stocks regularly OFFLINE - Manual Checking - Stock Distribution among the Inventory	Identify strong TR & EM Focus on TR, tap into EM
	4. EMOTIONS: BEFORE / AFTER EM Before - The user might feel confused and stressed about tracking their orders and might have struggles with the application UI. After - As they get acquainted with the software, it becomes easy and comfortable to use and track their order.

4. REQUIREMENT ANALYSIS:

4.1 Functional requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Form Registration through Gmail
FR-2	User Confirmation	Confirmation via Email Confirmation via OTP
FR-3	User Login	Login with username Login with Email Login with password
FR-4	Dashboard	View product availability, name of the product, stock keep unit, brand, retail price, product category, lot number, expiration date, vendor information, wholesale cost,etc.,
FR-5	Identification of the stock location	Provide number label for - shelf, rack and boxes
FR-6	Periodical stock checking	Automate the tracking of stock count
FR-7	Purchase management and Forecasting	Order review and placement, avoid risk stock, review product, priorities purchases based on an item's profitability, popularity, and lead time.
FR-8	Returns Management System	Examine for flaws or damage and return to the vendor if necessary. Add it to inventory counts if it is sellable.
FR-9	Markdown and promotion	Display product savings, Keep enough inventory on hand to satisfy demand.
FR-10	Calculating the death stock	Return the stock to the vendor for credits

Github link:

[Functional Requirements-Github](#)

4.2 Non-Functional requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	The success of deploying an inventory monitoring system in your company depends on usability. The system must be user-friendly and straightforward in the manner it presents all pertinent data and linkages, and its menus must include buttons that are simple to grasp. The software is not worthwhile if training takes hours for your workforce. Remember to pick a solution that makes inventory management simple. This variant is compatible with desktop browsers.
NFR-2	Security	It is the method for making sure that kept goods are safe and under the best management control. It is crucial for effective warehouse management because a warehouse's productivity and safety determines how well a firm performs. In this case, only authorized people with their username and password can access the system.
NFR-3	Reliability	The user must constantly receive accurate inventory status from the system. By routinely comparing the real levels to the levels shown in the system, any errors are fixed.
NFR-4	Performance	Every time a user requests a process, the system must successfully complete the tasks like updating the stocks in the database, adding new stocks, and deleting it. Every time the system is turned on, all of its features must be accessible to the customer. The system's calculations must adhere to the standards established by the customer and shouldn't change until the customer specifically requests a change.
NFR-5	Availability	Only the organization's admin will have access to the software, and it is he who will record information of the product as well as the customer details. A single item's inventory availability determines whether it is accessible for

		customer orders. The admin can also add, remove or update the stock and stock details respectively.
NFR-6	Scalability	The business will become considerably more scalable with the use of an automated inventory management system for inventory tracking, enabling it to capitalize on rising sales and maintain steady growth.

[Non-Functional Requirements-Github](#)

5. PROJECT DESIGN:

5.1 Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

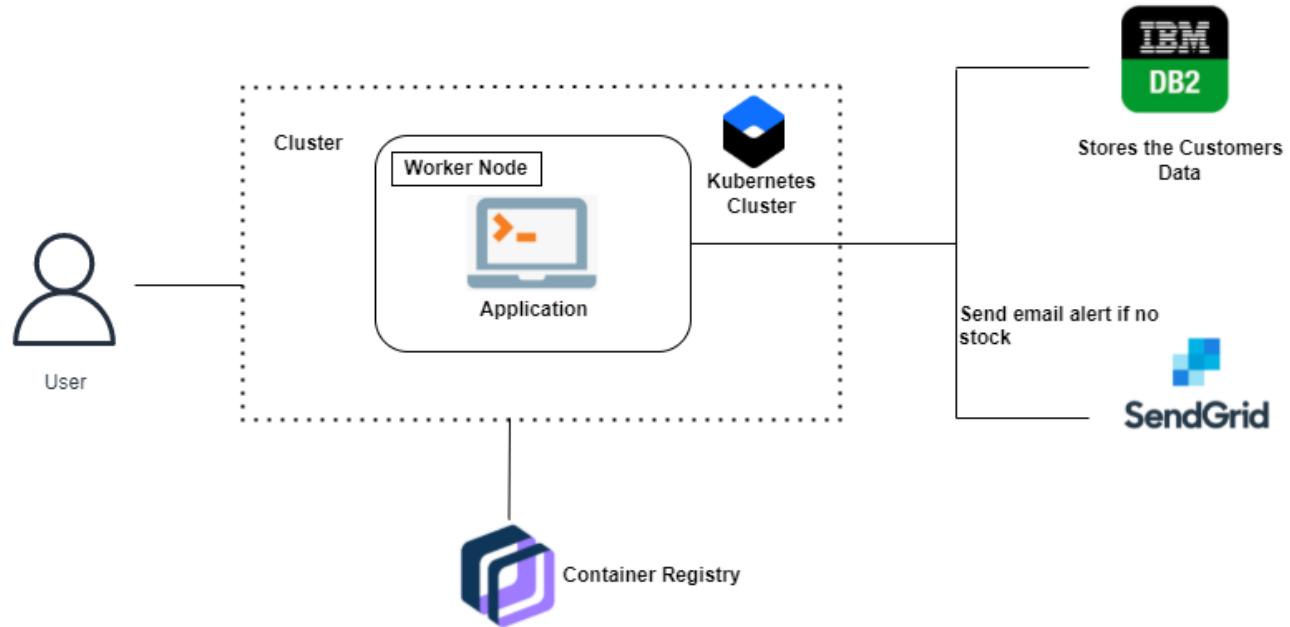

Github link:

[Data flow Diagrams-Github](#)

5.2 Solution & Technical Architecture:

Technical Architecture:

Solution Architecture:

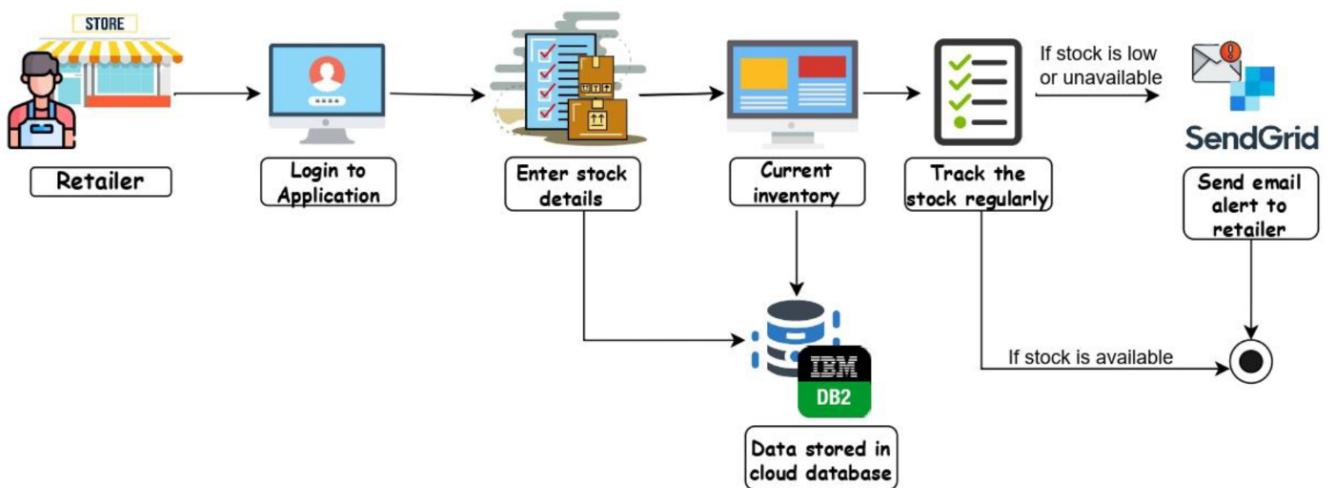

Table-1 : Components & Technologies:

S.No	Component	Description	Technology
1.	User Interface	Web UI, Mobile App, Chatbot etc.	HTML, CSS, JavaScript, React Js
2.	Application Logic - 1	Alert retailers in case of low stock	Python - Flask, Sen
3.	Application Logic - 2	Chatbot for CRM	IBM Watson Assistant
4.	Cloud Database	Database Service on Cloud	IBM DB2
5.	File Storage	File storage requirements	IBM Object Storage
6.	Infrastructure (Server / Cloud)	Cloud Server Configuration	Local, Cloud Foundry, Kubernetes.

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks	Used open-source frameworks for styling webpage and building web application	Python flask, Bootstrap
2.	Security Implementations	To keep user data secure, verify ownership of the website, prevent attackers from creating a fake version of the site, and convey trust to users.	SSL, IBM Cloud security
3.	Scalable Architecture	3 – tier architecture MVC	Web server - HTML, CSS, JS Application server - Python Flask, Docker, Container Registry Database server - IBM DB2
4.	Availability	To evenly distribute network traffic to prevent failure caused by overloading a particular resource	IBM Load Balancer
5.	Performance	Use of local machine Cache memory	IBM Cloud, CDN

8. TESTING :

8.1 Test Cases:

Test case ID	Feature Type	Component	Test Scenario	Team ID Project Name	PNT2022TMID03825 Inventory Management System for Retailers	Pre-Requisite	Steps To Execute	Test Data	Expected Result	Actual Result	Status	Comments	TC for Automation(Y/N)	BUG ID	Executed By
HomePage_TC_OO_1	Functional	Home Page	Displays sign in/signup actions to user and allows the access to chatbot	HTML, CSS, Python, Flask	1.Enter the URL in the browser and search it. 2.Home page of the website Servo-in is displayed in the browser.			Application displays the home page of website Servo-In	Working as expected	Pass					Dharshini T Om Arthy Sri B Srinithi S
SignUpPage_TC_OO_2	Functional	SignUp Page	User enters his unique personnel credentials and is redirected to sign in page	HTML, CSS, Python, Flask	1.Signup and Signin is present in the dashboard of the home page. 2.Click on the Signup button and it is redirected to signup page. 3.In Signup, the retailers must fill the required fields like name, username, password, company name, company location. 4.New user is created and their records are stored in IBM DB2			Username:riya Email:riya@gmail.com Password:riya Contact number:923467891 Company name:RRR Company location:Chennai	1. User can fill the required details and those details are stored in database. 2. After signup, the website is redirected to dashboard.	Working as expected	Pass	After sign up user is redirected to sign in page			Harini M Om Arthy Sri B Srinithi S
SignInPage_TC_OO_3	Functional	SignIn page	User is authenticated with his email and password and is redirected to his customized dashboard	HTML, CSS, Python, Flask	1.Signup and Signin is present in the dashboard of the home page. 2.Click on the Signup button and it is redirected to signin page. 3.Enter Valid username/email in Email text box 4.Enter valid password in password text box 5.Click on login button			Username:riya@gmail.com password: riya	1.Signin page is displayed. 2.After successful signin, dashboard is redirected	Working as expected	Pass	After sign in user is redirected to dashboard page			Harini M Dharshini T Srinithi S
DashboardPage_TC_OO_4	UI	Dashboard page	Displays the products in stock and out of stock and also displays the pictorial representation of instock products	HTML, CSS, Python, Flask	1.Enter URL and click go 2.Click on My Account dropdown button 3.Select login/signup from dropdown 4.Enter valid username/email in Email text box 5.Click on login button			Dashboard of the specific user is displayed along with product details, products price etc.	Working as expected	Pass	Dashboard displays all necessary details				Harini M Dharshini T Om Arthy Sri B
DisplayProductPage_TC_OO_4	Functional	Display Products page	Displays the instock products	HTML, CSS, Python, Flask	1.Enter URL and click go 2.User can either login/signup. 3.Once after login/signup, user will be redirected to dashboard. 4.Product display page is shown here.	AddStock:10 RemoveStock:5		1. Products are displayed in this page	Working as expected	Pass					Harini M Dharshini T
AddProductPage_TC_OO_5	Functional	Add Products page	Allows the user to add new products to the system	HTML, CSS, Python, Flask	1.Enter URL and click go 2.User can either login/signup. 3.Once after login/signup, user will be redirected to dashboard. 4.Retailers can add the product by clicking product button in dashboard. 5.Add product button is present in product display page and it is redirected to add product page on clicking it.	Product Id:1234 Product name:Clove StockAmount:5kg Price/Unit:40		1. Form to add products by user is displayed in this page	Working as expected	Pass					Om Arthy Sri B Srinithi S

8.2 User Acceptance Testing:

1. Purpose of Document

The purpose of this document is to briefly explain the test coverage and open issues of the [ProductName] project at the time of the release to User Acceptance Testing (UAT).

2. Defect Analysis

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	10	4	2	4	20
Duplicate	2	0	3	0	5
External	5	3	0	1	9
Fixed	12	2	5	20	39
Not Reproduced	1	0	1	0	2
Skipped	0	0	1	1	2
Won't Fix	0	5	2	1	8
Totals	30	14	14	27	85

3. Test Case Analysis

This report shows the number of test cases that have passed, failed, and untested

Section	Total Cases	Not Tested	Fail	Pass
Print Engine	8	0	0	8
Client Application	50	0	0	50
Security	3	0	0	3
Outsource Shipping	3	0	0	3
Exception Reporting	10	0	0	10
Final Report Output	5	0	0	5
Version Control	1	0	0	1

A decorative banner at the bottom features a variety of black line-art icons: a camera, two boxes, a large gear, a clipboard with a checklist, a checkmark, and a document with a checkmark. There are also smaller gears and geometric shapes.

Dashboard:

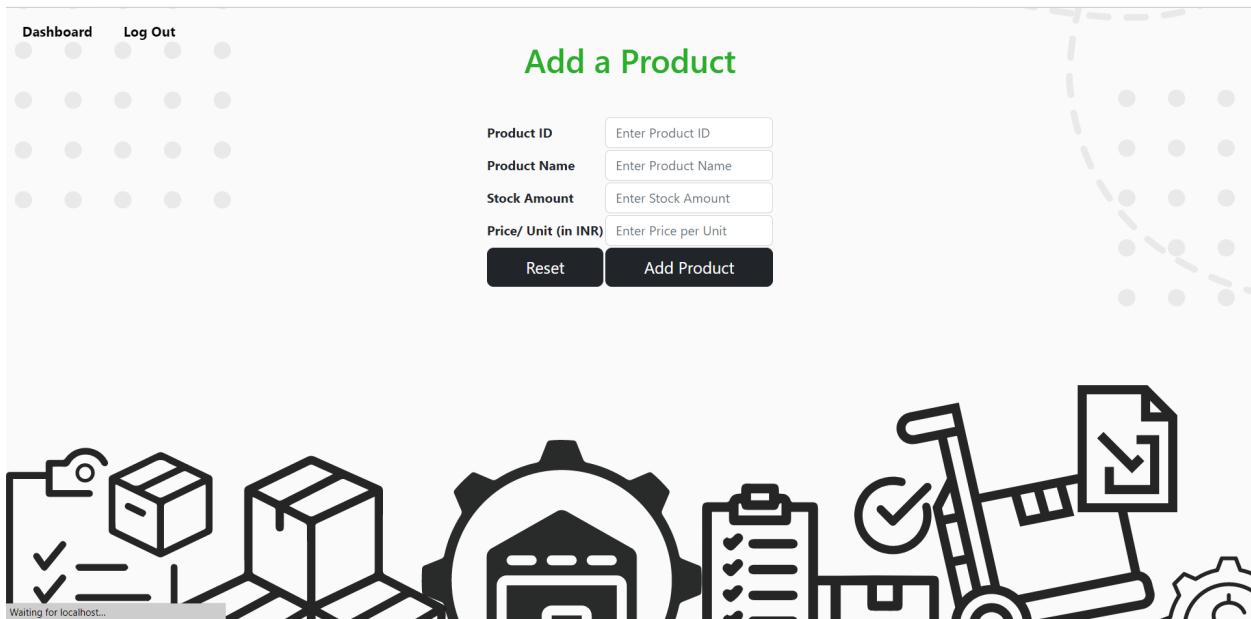

Products Page:

The product details page lists the following items:

Product ID	Product Name	Available Stock	Add Stock	Remove Stock	Delete Stock
101	Rice	50	<input type="text"/>	<input type="button" value="+"/>	<input type="text"/> <input type="button" value="-"/>
102	Wheat	45	<input type="text"/>	<input type="button" value="+"/>	<input type="text"/> <input type="button" value="-"/>
103	Chana Dal	20	<input type="text"/>	<input type="button" value="+"/>	<input type="text"/> <input type="button" value="-"/>

Decorative icons at the bottom represent various inventory management tasks like scanning, storage, and reporting.

Add Products Page:

The Add Products page features a header with 'Dashboard' and 'Log Out' buttons. The main title 'Add a Product' is centered above a form. The form contains four input fields: 'Product ID' (placeholder: Enter Product ID), 'Product Name' (placeholder: Enter Product Name), 'Stock Amount' (placeholder: Enter Stock Amount), and 'Price/ Unit (in INR)' (placeholder: Enter Price per Unit). Below the form are two buttons: 'Reset' and 'Add Product'.

Chatbot Integration in Home Page:

The home page for 'Servo-IN' includes a navigation bar with 'Home', 'SignIn', and 'SignUp' links. The main heading 'Servo-IN' is displayed in large green letters with the tagline 'From us to you!!' below it. On the left, a woman is shown interacting with a large smartphone screen that displays a virtual store interior. On the right, a floating blue rectangular window represents a chatbot interface. The window contains the text 'Hi! I'm a virtual assistant. How can I help you today?'. Below this, a message history shows 'hi' and 'Product'. At the bottom of the window is a text input field with 'Type something...' placeholder text and a send button.

10. ADVANTAGES & DISADVANTAGES:

Advantages:

- Reduced Risk of Overselling
- Cost Savings
- Avoiding Stockouts and Excess Stock
- More Productivity
- Increased Profits
- Better Customer Experience

Disadvantages:

- Expensive for Small Businesses
- Complex to Learn
- Risk of System Crashes
- Malicious Hacks

11. CONCLUSION:

A highly difficult but crucial component of the supply chain is inventory management. Stock-related expenses, such as warehousing, carrying, and ordering costs, can be decreased with the aid of an efficient inventory management system.

12.FUTURE SCOPE:

Since we had very little prior understanding of the Inventory Management System when we began this project, we learned about the improvement capacity as we built it. Below are some of the areas of focus we might broaden for improved efficiency:

- > Designing an interactive user interface.
- > manage stock prudently
- > Making the system adaptable to any situation.
- > To enable product returns, a sales and buy return mechanism will be developed.

OUTLINE TIMELINE

Ln 1, Col 1 Spaces: 4 UTF-8 CRLF Python 3.10.2 64-bit

sendGrid.py:

The screenshot shows a code editor interface with the following details:

- File Explorer:** On the left, there is a tree view of files and folders. The current file is `sendGrid.py`. Other visible files include `service.yaml`, `deployment.yaml`, `Dockerfile`, `README.md`, and `requirements.txt`.
- Code Editor:** The main area displays the `sendGrid.py` script. The script imports `SendGridAPIClient` from `sendgrid`, `os`, `dotenv`, and `ibm_db`. It defines two functions: `mailto()` and `checkstatus()`. The `mailto()` function sends an email with a subject and content. The `checkstatus()` function queries a database to find products whose available stock has dropped below a threshold value.
- Terminal:** At the bottom, there is a terminal window showing the command `git add .` followed by the output of `git status`, which indicates the file `sendGrid.py` has been added.

```
from sendgrid import SendGridAPIClient, Mail
import os
from dotenv import load_dotenv
import ibm_db

load_dotenv()

def mailto(email, subject, content):
    message = Mail(from_email='servo.inventory@gmail.com', to_emails=email,
                   subject=subject, html_content='{}<strong>{}
```

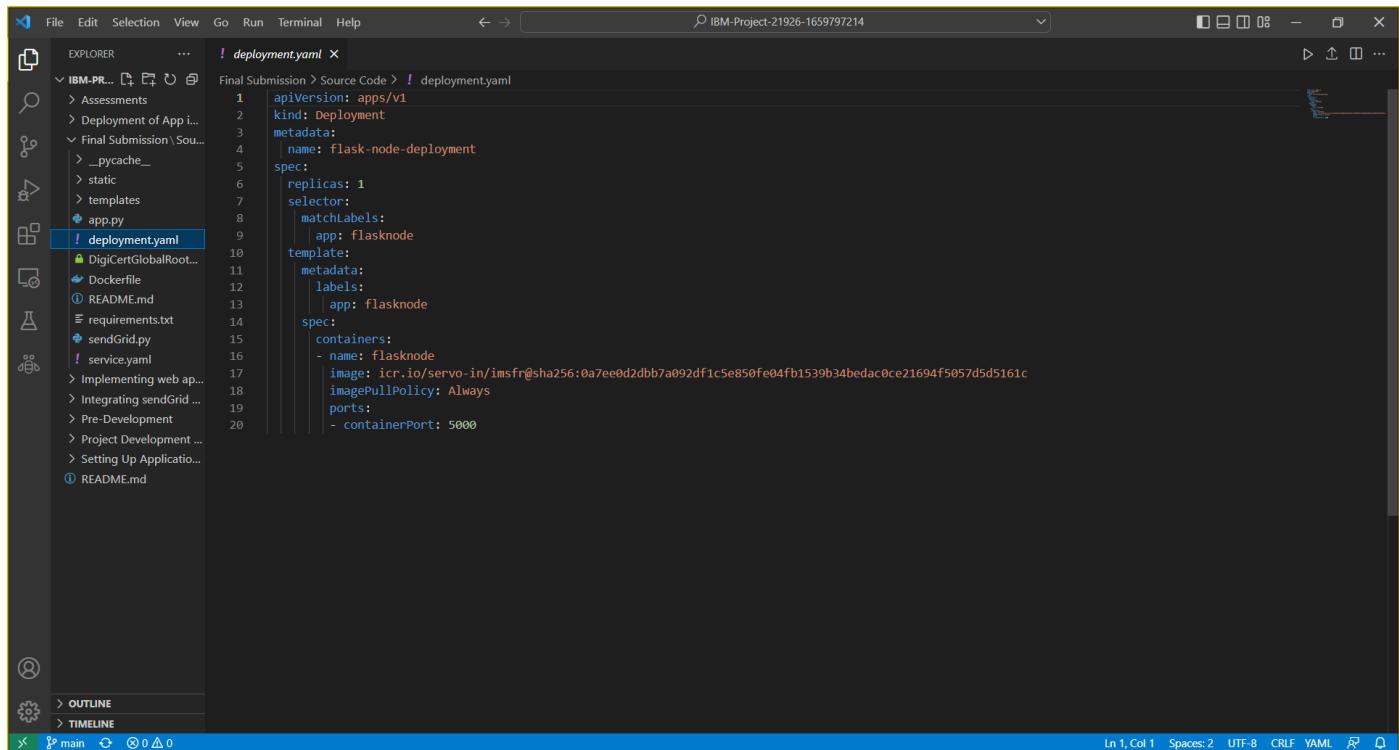

DockerFile:

The screenshot shows the IBM Project Explorer in Visual Studio Code. The sidebar on the left displays a tree view of project files, including a Dockerfile, README.md, requirements.txt, sendGrid.py, and service.yaml. The Dockerfile is currently selected and its content is shown in the main editor area:

```
FROM python:3.6.0
WORKDIR /usr/src/app
COPY requirements.txt requirements.txt
RUN pip install -r requirements.txt
COPY .
CMD [ "python3", "-m", "flask", "run", "--host=0.0.0.0"]
```

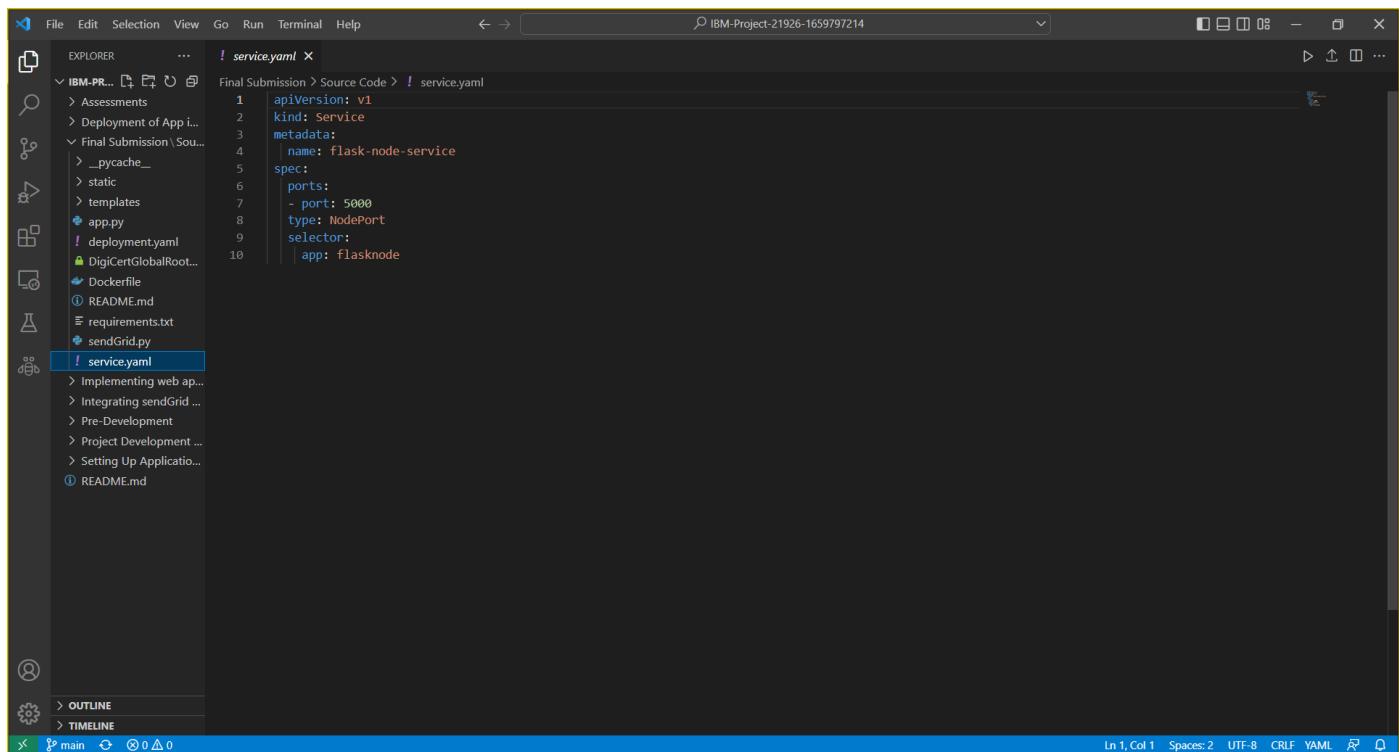

A modal dialog at the bottom right asks if the user wants to install recommended Docker extensions, with 'Install' and 'Show Recommendations' buttons.

deployment.yaml:

```
! deployment.yaml
apiVersion: apps/v1
kind: Deployment
metadata:
  name: flask-node-deployment
spec:
  replicas: 1
  selector:
    matchLabels:
      app: flasknode
  template:
    metadata:
      labels:
        app: flasknode
    spec:
      containers:
        - name: flasknode
          image: icr.io/servo-in/imsfr@sha256:0a7ee0d2dbb7a092df1c5e850fe04fb1539b34bedac0ce21694f5057d5d5161c
          imagePullPolicy: Always
          ports:
            - containerPort: 5000
```

service.yaml:

```
! service.yaml
apiVersion: v1
kind: Service
metadata:
  name: flask-node-service
spec:
  ports:
    - port: 5000
      type: NodePort
  selector:
    app: flasknode
```
